

Where Engineering meets Product Thinking.

WHO WE ARE

A multidisciplinary team built for end-to-end delivery.

We bring together the skills needed to develop a project or feature from start to finish, in an iterative and collaborative way. Delivering the best value to every stakeholder.

How we are structured

What we stand for

To engineer technology that scales businesses and elevates the standard of technical and cultural excellence in every company we work with, and in the Portuguese ecosystem.

Engineering First

Solid technical decisions over commercial shortcuts.

Ownership Mentality

Every person acts as a builder, not a executor.

Transparency

Clear communication. Direct feedback. No political games.

Cultural Discipline

High performance and a healthy environment, both non-optional.

Long-Term Thinking

We don't build for the quarter. We build to last.

What we offer

1

Product Development

End-to-end digital products from discovery to launch, with product thinking at every step.

2

Complex Systems

Scalable, resilient critical systems designed for real-world complexity.

3

Data & AI

Data platforms, machine learning pipelines and applied AI solutions.

4

Cloud & Security

Infrastructure, DevOps, compliance and security hardening.

5

Nearshore Teams

Dedicated engineering teams embedded in your processes and culture.

6

Product Innovation

Build and co-create new products with your team, from idea to validated MVP.

OUR DNA

Built in a real-world complexity

● Product Development

Experience building a digital bank from scratch (radicant bank ag), operating in demanding fintech and enterprise environments.

● Integrated Product + Engineering

We operate at the intersection of engineering and product. No silos, no handoff friction, just one team with a shared goal.

● Culture of ownership

Every person acts as a builder. We take full accountability for outcomes, not just deliveries.

● Long-term partners

We don't just deliver a scope and disappear. We partner with companies that want to build what matters and think long-term.

HOW WE WORK

Discovery Process

Discovery is how we reduce risk, align teams, and ensure we are solving the right problems before scaling delivery.

Collaboration: Product & Engineering are embedded throughout, discovery isn't a silo. If implementation reveals new insights, we loop back.

HOW WE WORK

Creating Business Value Through Discovery

"We don't just make things pretty, we make things that matter to your bottom line."

Faster time-to-value

Ship the right thing, not everything

- Validate demand before engineering resources are committed
- Identify high-impact, low-effort opportunities
- Kill bad ideas early (cheaply)

Lower risk

Validate before you scale

- Design thinking meets business thinking
- Avoid costly reword by validating assumptions first

Higher adoption

Solutions rooted in real user needs

- User needs <> Business goals aligned
- Desirability + Viability + Feasibility
- ROI-focused prioritisation

Measurable impact

Track designer's contribution to KPIs

- Outcome > Output
- Continuous validation loop: Build > Measurable > Learn

Feature Development Process : Phases 1 – 3

Every new feature follows a structured process to ensure quality and alignment.

Feature Development Process : Phases 4 - 6

Every new feature follows a structured process to ensure quality and alignment.

How We Integrate With Your Team

Weekly Sync & Planning

Your stakeholders join our iteration planning. Feature Spec, architecture, test strategy and rollout reviewed together every week.

Shared Documentation

Continuously updated (not just at the end) and hosted wherever works for your. Notion, Confluence, or your own system.

Ad Hoc Deep Dives

Dedicated sessions whenever deeper protocol or integration discussions are needed, no bureaucratic scheduling,

Transparent Backlog

All tasks are traceable to issue IDs, PRs are open for review, and scope is visible in real time.

Every touchpoint is designed so your team stays informed, aligned and in control, without slowing down delivery.

Branching Strategy & Quality Gates

Branching & Code Review

- Master-based development with short-lived feature branches
- Mandatory pull requests on all changes
- Minimum two reviewers, emphasis on business-flow and architectural changes
- Every commit traceable to a Task Management issue ID (Jira / Linear / etc.)

Quality Gates

- Mandatory Unit & Integration tests with mocks on all PRs, and usage of simulators/emulators/test containers when applicable.
- Tests with real-world payloads and production flows
- SAST / Vulnerability scans on every main-branch build

Quality Workflows

Quality Assurance Engineering

- Business, user-flow focus and risk-based testing: positive, negative, boundary and unexpected behaviors
- Cross-platform and multi-layer validation: web, mobile, external and internal APIs
- Strong regression mindset: automate stable, repetitive and critical regression scenarios cross-platforms
- Process-driven quality ownership: test case to requirement linkage, coverage, progress tracking, defect handling and controlled quality gates

DevSecOps Engineering

- Security gates built into the development workflow: SAST, vulnerability checks, secrets management, IaC and container scanning on commits, PRs and builds
- Automation as primary enforcement mechanism: compliance governing software supply-chain risks and security policies implemented through CI/CD pipelines
- Generation of auditable evidence of control effectiveness
- Vulnerability and incident management is SLA-driven

Data and Machine Learning Architecture

Our architectural pillars supporting intelligent, data-driven delivery.

Infrastructure deployed on cloud using Terraform – services chosen for best practices, cost efficiency and specific use requirements / Google Cloud / Azure DevOps / Terraform

Let's build what matters.

If you're thinking long-term, building serious products and solving real problems – *we should talk.*
